

«C++ for C Programmer» Notes

by Firmin Martin

Week 1

From C to C++

C	C++
<code>#include <stdio.h></code>	<code>#include <cstdio></code>
	<code>using namespace std</code>
<code>#define PI 3.14</code>	<code>const float PI = 3.14</code>
<code>#define max(a,b) (...)</code>	<code>inline max(a, b) {...}</code>

Simple I/O functions

```
cout << "Print something" << endl
```

```
cin >> input
```

Cast

static cast : (safe cast) `static_cast<double> 5/4`
Convert if there is a rule based conversion, otherwise error

reinterpret cast :

dynamic cast : used with object

const cast : cast away const-ness

Function call

Call by value

Call by pointer

Call by reference

[An Introduction to Reference](#)

C++ Overload

```
inline void swap(int &i, int &j) {
    int tmp = i
    i = j
    j = tmp
}

inline void swap(double &i, double &j) {
    double tmp = i
    i = j
    j = tmp
}
```

C++ Generic

```
template<class T>
inline void swap(T &i, T &j) {
    T tmp = i
    i = j
    j = tmp
}
```

Week 2

Function default parameter

```
T sum (T arr[], int count, T s = 0)
```

C++ Multiple template arguments

```
template <class T1, class T2>
void copy (const T1 src[], T2 dest[], int size) {

    for (int i = 0; i < size; ++i) {
        dest[i] = static_cast<T2>(src[i]);
    }
}
```

C++ Enumerate type

```
typedef enum {MONDAY, TUESDAY, WEDNESDAY, THURSDAY, FRIDAY,
    ↪ SATURDAY, SUNDAY} days;
```

C++ Operator overloading

```
inline days operator++ (days d) {
    return static_cast<days>((static_cast<int>(d) + 1) % 7);
}
```
